

I did not start a rocketry club during my freshman year because I wanted to put it on a resume. I started it because it would be an inspiring, sometimes frustrating, and unbelievable experience. There is nothing more invigorating than inspiring my peers to chase their dreams with the same drive and curiosity I have. Before I entered university, building was my pastime and space was my dream. Anyone has the power to chase their dream, big or small. Every waking day of my life is committed to being part of a team that is going where no one has gone before, quite literally. Passion sparks innovation, and innovation drives new adventures. I want to be a part of the next space race that will bring us to places foreign to everyone. My passions leave me needing to do everything I can to be part of an engineering team that tackles problems that involve rocket propulsion, aerodynamics and long-term space travel.
